Summary

Data scientist with expertise in machine learning, deep learning, predictive analytics, and big data. Built models and automation pipelines to solve business problems across domains using Python, SQL, and cloud tools. Hands-on with LLMs, GenAI (RAG, embeddings), NLP, and real-time alerting systems. Focused on building smart, usable solutions that delivers real business impact.

Education

•National Institute Of Technology Patna

Bachelor of Technology

2020 - 2024

CGPA: 8.1

Work Experience

•Acuitas 360

Data Scientist

May 2024 - present

- Developed segmentation tools using Python and scikit-learn to improve HCP targeting accuracy by 35%.
- Built a CRM app for the field force; integrated LLM-based summarization to analyze internal call transcripts and improve follow-up accuracy by 45%.
- Applied RAG architecture for context-aware call insights using vector embeddings and semantic search, improving CRM usability and traceability.
- Automated REST API pipelines to ingest sales and claims data, reducing processing time by 40%.
- Built and deployed a predictive model to identify patients likely to start new therapies based on claims patterns; integrated into Azure ML pipeline to trigger commercial alerts in real time.
- Created real-time reporting dashboards integrated with backend APIs, reducing manual reporting by 50%.

•Acuitas 360

Data Science Intern

Sept 2023 - April 2024

- Designed scalable ETL pipelines using Azure Data Factory to process 1M+ records from structured and unstructured sources.
- Built a unified web platform integrating reporting tools and scalable backend services, leveraging cloud infrastructure to enhance reliability and cross-functional visibility.
- Developed Power BI dashboards for pharma risk analytics, improving decision-making for clients.

•Coding Ninjas

Teaching Assistant

Feb 2022 - Apr 2022

- Provided mentorship to 60+ students, resolving 200+ coding doubts via live sessions and chat.

Projects

•Heart Attack Analysis and Prediction

Advanced machine learning model for heart attack risk assessment

- Built a binary classifier using XGBoost with clinical features achieving 93% ROC-AUC.
- Focused on data preprocessing, feature engineering, and hyperparameter tuning for medical prediction problems.

•Twitter Sentiment Analysis

Large-scale sentiment analysis of Twitter data

- Processed 1.6 million tweets and built a sentiment classification model with 82% accuracy using Logistic Regression.
- Applied TF-IDF vectorization to reduce dimensionality while preserving valuable text data.

•Automated Resume Review System

Resume screening system

- Used n8n to orchestrate data flow between Google Sheets and OpenAI's GPT-4 API.
- Built a workflow to extract resume data, send it to a prompt-engineered GPT node, and return scored feedback in real time.

Skills

Programming: Python, SQL, C++, JavaScript

Machine Learning: Predictive Analytics, Risk Modeling, Time Series Forecasting

NLP and AI Models: Large Language Models (LLMs), Named Entity Recognition, Sentiment Analysis

Deep Learning: TensorFlow, PyTorch, Keras, CNN, RNN

Big Data and ETL: Apache Spark, Azure Data Factory, SQL, Alteryx

Visualization and BI Tools: Power BI, Tableau, Matplotlib, Seaborn

Experimentation and Analytics: A/B Testing, Feature Engineering, Data Wrangling
